

# Co-design as a strategy

At Science For Change we address social, environmental and health challenges. We are leaders in **collaborative research processes, citizen science, scientific communication and in applying co-creation strategies** transversally, in any field of knowledge.

The inclusion of all parties involved in research and development processes has become a **transversal need**. Involving different agents **increases the impact of projects**, expanding the collection of new data and contributing to more innovative, sustainable results aligned with the needs of different agents and society.

We **involve relevant actors** and develop methodologies for everything you need to do **collaboratively**.

Start your path towards co-design with  
Science For Change

We co-design tailor-made solutions for  
you

## How can we help you?

- **We guide you to co-design** strategic plans, research projects, products, services and, ultimately, to **innovate**, focusing on finding the best solutions to a challenge from a practical point of view.
- **We facilitate collaborative processes**, designed by us or that you already have designed. We recruit the necessary participants, organise the session and facilitate it to get the most out of it.
- **We train** in *design thinking* and collaborative dynamics so that you can be the one who designs, organises and facilitates co-design sessions. We provide the necessary tools and knowledge so you can be independent.
- **Tools For Change**, the methodological co-design toolkit to carry out co-creation sessions in different areas.

**Ask for more information** about our training plans and services to take your first step towards change.
